                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of BASB110 protein from Moraxella catarrhalis strain Mc2931 (ATCC 43617), a causative agent of othitis media in children and pneumonia in adults. The sequence is a translation of the BASB110 gene coding region (see AAF30046). It differs by 1 residue from the predicted polypeptide sequence (see AAB20107) of a BASB110 PCR product, having Ser rather than Gly at position 104. The invention provides BASB110 polypeptides, and polynucleotides encoding them, as well as expression vectors, host cells and methods for producing BASB110 polypeptides using recombinant methods. Also claimed is a vaccine composition comprising a BASB110 polypeptide, or a polypeptide, or a immunogenic fragment of a BASB110 polypeptide, or a polypeptide and sequence identity to BASB10 or comprising a polypuchide composition used a polypeptide. A claimed method of diagnosing a conding such a polypeptide. A claimed method of diagnosing a contribody. A claimed therapeutic composition useful in treating the manns with M. catarrhalis infection composition useful in treating catarrhalis in a polypeptide. BASB110 polypeptides also have utility in raising specific antibodies, and in screening for antibacterial drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                          δ
                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of BASB110 protein from Moraxella catarrhalis strain Mc2931 (ATCC 43617), a causative agent of otitis media in children and pneumonia in adults. The sequence is a translation of a BASB110 pcr product (see AAP30047). It differs by 1 residue from the predicted polypeptide sequence (see AAB20106) of the BASB110 gene product, having Gly rather than Ser at position 104. The invention provides BASB110 polypeptides, and polynucleotides encoding them, as well as expression vectors, host cells and methods for producing BASB110 polypeptides using recombinant methods. Also claimed is a vaccine composition comprising a BASB110 polypeptide, an immunogenic fragment of a BASB110 polypeptide, or a polypeptide having at least 85% amino acid sequence identity to BASB110, or comprising a polynucleotide encoding such a polypeptide. A claimed method of diagnosing a Moraxella infection involves identifying a BASB110 polypeptide or antibody. A claimed therapeutic composition useful in treating humans with M. catarrhalis infection comprises at least 1 antibody directed against a BASB110 polypeptide. BASB110 polypeptides also have utility in raising specific antibodies, and in screening for antibacterial drugs.
                                                                                                                                                                                                                                                                                               Query Match

                                                                                                       capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511).

                                                                                                                                                                                                                                                                                                                   The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nakagawa

CC polypeptide (HTLAR33). Host cells transformed with an expression
CC comprising the HTLAR33 nucleic acid are used for the recombinant
CC production of the protein. HTLAR33 polynucleotides and polypeptides are
CC useful for are useful for diagnosing susceptibility to diseases and for
CC screening for antagonists, agonists. These can be used in treatment to
CC enhance (agonist) or block (antagonist) HTLAR33 activity. Diseases
CC diagnosed, prevented or treated include: bone loss and inflammatory
CC (ARDS), Rheumatoid arthritis, osteoarthritis, Inflammatory Bowel Disease
CC (IBD), psoriasis, dermatitis, asthma, allergies; bacterial, fungal,
CC septic shock; pain; injury, cancers, anorexia, bullimia, Parkinson's
CC disease, cardiovascular disease including restencies; atherosclerosis,
CC acute heart failure, myocardial infarction; hypotension; hypertension;
CC urinary retention, angina pectoris; ulcers; benign prostatic hypertension;
CC urinary retention, angina pectoris; ulcers; benign prostatic hypertension;
CC depression, anxiety; delirium, dementia, severe mental retardation and
CC dyskinesias, such as Huntington's disease or Gilles de la Tourette's
syndrome. HTLAR33 polypeptides are also useful for mapping genes to
CC cand psgis.
                                                                                                                                                                                                                                                                                                                                                                    Query Match

The helper DNA sequence encodes a ecotropic Moloney murine leukaemia virus (MMLV) or gibbon ape leukaemia virus (GALV) gag and pol; and a xenotropic, amphotropic, ecotropic or polytropic envelope protein. The packaging plasmids, designated KAT plasmids, are used with a second retroviral vector encoding a foreign gene of interest to produce mammalian cells with retroviral supernatants that express, e.g. a hormone, lymphokine, growth factor or coagulation factor. The plasmids are useful in construction of stable cell lines that constitutively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This linker peptide is used to construct a plasmid pIK98.6-K/L/H which is used in the construction of a retroviral packaging plasmid used for the production of high titres of recombinant retrovirus in human cells. The retroviral packaging plasmid comprises a retroviral helper DNA sequence derived from a replication incompetent retroviral genome that encodes, the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              retrovirus particles: gag, pol and env. The stable produce reels continue to produce high titre retrovirus indefinitely in the absence of drug selection due to the stable integration of both packaging function and virus vector. The retroviral vector plasmids are constructed with sequences enabling the episomal persistence without the need for stable integration of the vector plasmid. The Env gene determines the host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo

                                                                                                                                 The invention relates to treating viral or malignant diseases using modified T cells that express proteins comprising (in an N-terminal to C-terminal direction) single chain antibody binding domains (that bind to viral or tumour antigens), transmembrane domains and cytoplasmic signal transducing domains. When the single chain antibody domain binds to the viral or tumour antigen on the cell, the modified T cells kill cells expressing the antigens. The modified T cells are used for treating malignant diseases and viral infection especially by, human immunodeficiency virus (HIV), cytomegalovirus, hepatitis G, hepatitis B, and mycobacterium avium. The present sequence is peptide linker used to link together the functional peptides of the chimaeric antibody molecule
                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Virucidal; cytostatic; peptide linker; anti-HIV;

The nucleic acid molecule may be used via recombinant DNA methodologies in the production of transgenic animal (especially mouse) models for studying genetic abnormalities related to mass1 which result in seizure susceptible phenotypes (mass1 is audiogenic seizures). The present sequence is mouse monogenic audiogenic seizure-susceptible (mass1) protein conserved amino acid repeat motif.

Note: The present sequence (SEQ ID NO:16) is incorrectly referred to as SEQ ID NO:15 in the sequence listing of the specification.
                                                                                                                                                                                                                                                                               Human; open reading frame; ORRX; gene thorapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease;

CC (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABNI5762 to ABNI7752 encode the human ORFX CC in the specification). ABNI5762 to ABNI7752 encode the human ORFX CC proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated CC disorder in humans, and in the manufacture of a medicament for treating a grathology associated with an ORFX-associated CC sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, CC psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, CC osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic CC lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious CC diseases, autoimmune thyroiditis, myasthenia gravis, graft-versus-host CC disease, and autoimmune inflammatory eye disease. ORFX proteins are also cuseful for treating burns, incisions, vulcers, for treating osteoporosis, CC useful for treating burns, incisions, vulcers, for treating osteoporosis, CC useful for treating burns, incisions, vulcers, and for gut creperfusion injury in various tissues and conditions resulting from CC NB. The sequence data for this patent did not form part of the printed condition, but was obtained in electronic format directly from WIPO at figure in the later, and for condition, but was obtained in electronic format directly from WIPO at figure in the later, and for conditions resulting from wipo.

(1) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polynucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54590 and AAM82169 represent sequences used in the exemplification of the present invention.

The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAZ24802) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 95 novel genes and their fragments (nucleic acid sequences: AAZ24801-Z24907); amino acid sequences AAY41308-Y41404) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polymucleotides in a sample or by determining the presence of mutations in the new polymucleotides. Specific uses are described for each of the 95 polymucleotides, based on which tissues they are most highly expressed in (see AAZ24811 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 199

polypeptides. The proteins and

AAU39105-AAU68017 represent Propionibacterium acnes

their associated DNA sequences

immunogenic are used in

Example 1; SEQ ID No 22782; 1069pp; English.

CC the treatment, prevention and diagnosts of medical conditions caused by CC P. acnes. The disorders include SAPHO syndrome (synovitis, acne, cC pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. CC P. acnes is also involved in infections of bone, joints and the central CC nervous system, however it is particularly involved in the inflammatory CC lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a CC sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The CC polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to CC downregulate expression and activity of P. acnes polypeptides and CC therefore treat P. acnes infections. The antibodies may also be used as CC diagnostic agents for determining P. acnes presence, for example, by CC where linked immunosorbent assay (ELISA).

CC Note: The sequence data for this patent did not form part of the printed can be used for the proper can be used to constitute the proper can be used as consecuted immunosorbent assay (ELISA).
